## FL Example Programs

An FL program that defines a function that counts the number of elements in a given list:

```
(  
  (count (L) = (if (null L)  
                   0  
                   (+ 1 (count (rest L)))))  
)
```

An FL program that defines reverse which uses append:

```
(  
  (reverse (X) = (if (null X)  
                     nil  
                     (append (reverse (rest X))  
                               (cons (first X) nil))))  
  
  (append (X Y) = (if (null X)  
                      Y  
                      (cons (first X) (append (rest X) Y))))  
)
```

An FL program that defines a higher order function which takes a function as an input parameter

```
(  
  (mapcar (F L) = (if (null L)  
                      nil  
                      (cons (F (first L)) (mapcar F (rest L)))))  
  
  (plus1 (X) = (+ X 1))  
)
```
